

Sourdough bread method. A starter of flour and water ferments naturally using wild yeast and lactic acid bacteria. The baker combines starter with flour, water, and salt to form the dough. The baker shapes the dough, then proves the dough overnight in a refrigerator. Slow fermentation develops flavour in the dough crust. Steam during the first minutes of baking keeps the crust flexible so the oven spring can open the crumb.

Risotto technique. Arborio rice is toasted in butter before broth is added. The cook ladles hot broth into the rice gradually, stirring often so the rice releases starch. The cook finishes the risotto with butter and parmesan off the heat. Resting the risotto briefly before serving improves its texture. Stock kept at a gentle simmer prevents the rice from cooking unevenly.
